

UPDATED CANCELLATION & SERVICE CREDIT POLICY — VERSION 2.0

Test Document for Admin Policy Updates and Agent Change Detection

1. Document Metadata

- Document ID: POL-CANCEL-CREDIT-V2
- Document Type: Policy
- Status: ACTIVE
- Authority Level: 2 — Global Policy
- Effective Date: 01 September 2026
- Supersedes: Cancellation & Service Credit Policy / SOP Version 1
- Scope: All customer accounts unless an active customer-specific agreement explicitly overrides this policy
- Purpose: Test whether newly ingested administrative policy changes are reflected in subsequent agent answers

2. Purpose

- This document intentionally introduces revised default rules so an ADMIN can upload it and verify that the agent changes its answers after ingestion and activation. Customer-specific agreements with explicit applicable overrides must continue to take precedence.

3. Source Precedence Rules

- Active customer-specific agreement with an explicit applicable override takes precedence over this global policy.
- This Version 2.0 policy takes precedence over the previous global Cancellation & Service Credit Policy / SOP.
- Historical tickets, old guidance, and deprecated documents may provide context but must not determine current policy decisions.
- If two current applicable sources conflict and no precedence rule resolves the conflict, return CONFLICT_REQUIRES_VERIFICATION.

4. Updated Default Cancellation Policy

- Cancellation before carrier assignment: no cancellation fee.
- Cancellation after carrier assignment but before physical pickup: 2% of order value, maximum INR 750.
- Cancellation after physical pickup: 10% of order value, maximum INR 2,500.
- An active customer-specific agreement explicitly overriding cancellation terms takes precedence.
- All fee calculations must be performed by deterministic backend logic, not free-form model calculation.

5. Updated Default Service Credit Policy

- A service credit may be considered when delay exceeds the applicable committed service window.
- Default eligibility requires evidence that the delay was materially attributable to carrier or platform operations.

- Default maximum service credit: INR 1,000 or 15% of eligible order value, whichever is lower.
- No credit may be promised when root cause or fault attribution is unavailable.
- An active customer-specific agreement with explicit service-credit terms overrides these defaults.
- Missing required evidence must produce NEEDS_MORE_INFORMATION.

6. New Administrative Change: Priority Review Threshold

- Any cancellation request with order value above INR 50,000 requires Priority Review before a final fee decision is presented.
- The agent may explain the policy but must not finalize or promise the fee outcome until the review requirement is satisfied.
- Expected status when required review evidence is absent: HUMAN_JUDGMENT_REQUIRED or NEEDS_MORE_INFORMATION.
- A customer-specific agreement explicitly changing this requirement takes precedence.

7. Required Agent Behavior After Upload

- ADMIN uploads the document through the authorized document-management interface.
- Backend stores version, status, authority, effective date, scope, and supersession metadata.
- Document is parsed, chunked, metadata-tagged, embedded, and stored in PostgreSQL/pgvector.
- Version 1 is marked SUPERSEDED or excluded from current decisions.
- Version 2 becomes retrievable only after successful ingestion and activation.
- The agent must reflect the new rules in subsequent answers without model retraining.

8. Required Test Queries

- A. Default cancellation: Ask the same cancellation-fee question before and after upload; after upload the answer must use 2%, maximum INR 750, unless an agreement overrides it.
- B. Service credit: Ask the maximum credit; after upload the answer must use INR 1,000 or 15%, whichever is lower, subject to eligibility.
- C. Northstar/LumenWorks override: confirm a valid customer-specific agreement still beats Version 2.0.
- D. Historical ticket: confirm an old ticket cannot override the active policy.
- E. INR 75,000 cancellation: confirm the new Priority Review requirement is detected before finalizing the outcome.

9. Expected Retrieval and Trust Logic

- Filter by ACTIVE status and effective date.
- Exclude SUPERSEDED/deprecated policies from current decisions.
- Check account scope and customer-specific applicability.
- Apply explicit overrides before default global rules.
- Similarity alone is insufficient.
- If both Version 1 and Version 2 are retrieved, Version 2 must win for current global decisions after metadata validation.
- If a valid agreement explicitly overrides Version 2 for the relevant domain, the agreement wins.

10. Admin Upload and Activation Requirements

- Only authorized ADMIN users can upload or activate policy documents.

- Minimum metadata: document_type, status, authority_level, effective_date, scope_type, version, supersedes_source_id where applicable.
- Admin can view ingestion status.
- Failed ingestion must never silently mark a policy ACTIVE.
- Activation creates an audit event with document ID, version, actor, timestamp, and resulting status.
- Recommended: support rollback by deactivating Version 2 and restoring the previous active version.

11. Acceptance Criteria

- After successful activation, new default-policy questions use Version 2.0.
- Previous global policy no longer determines current answers.
- Customer agreements still override Version 2 where explicitly applicable.
- Historical tickets do not override active policy.
- The INR 50,000 Priority Review rule is applied.
- Failed ingestion does not change decision behavior.
- Admin actions are logged.
- The agent can identify the active source used for its answer.

12. Recommended Demo Flow

- Ask the agent a policy question and record the answer under the existing policy.
- Log in as ADMIN.
- Upload this Version 2.0 policy.
- Verify ingestion success and ACTIVE status.
- Ask the exact same question again and verify the answer changes.
- Ask a Northstar or LumenWorks question and verify the agreement still overrides the new global policy.
- Optionally deactivate/roll back Version 2.0 and verify behavior changes accordingly.
